

OpenClaw — User Manual

Version 1.0 · Sprint Testing Release

What is OpenClaw?

OpenClaw is a team platform that runs on a shared server. Every team member connects to it from their own machine using a browser. It gives the team a single place to manage sprint status, share documents, search across project content, and understand the complexity of what is being built.

Getting Started

Accessing the Dashboard

Open your browser and go to the address your manager provided, for example:

```
http://192.168.1.50:3000
```

Log in with your email and password. Contact your manager if you do not have an account.

The Five Main Areas

Navigate using the sidebar on the left.

1 — Dashboard

What it shows: Every team member's current sprint status and risk level on one screen.

Stat cards at the top:

- Critical Risk — members with a blocking issue

-  Delayed — sprint tasks behind schedule
-  Open Issues — unresolved bugs or blockers
-  On Track — members progressing normally

Status table: Each row is a team member. The columns show their risk level, sprint status, open issue, and when they last updated.

Updating your own status:

1. Find your row in the table
2. Click your row to expand it, or double-click to open the edit form
3. Update your Risk Level, Sprint Status, Issue, and Comments
4. Click **Save Update**

Risk levels — use these consistently:

Colour	Level	When to use
 Red	Critical	Hard blocker — cannot proceed without resolution
 Orange	Moderate	Significant risk — likely to affect delivery
 Yellow	Minor	Small risk — being managed, not blocking
 Green	None	No issues — on track

The AI engine reviews your entry and may adjust the risk level if the detail you provide suggests a different severity. You will see the confirmed level in your row.

2 — Team Summary

A card view of every team member showing their risk, sprint status, and issue status at a glance. Useful for a quick pre-standup overview.

3 — Documents

What it does: Stores, versions, and shares team documents — requirements, design specs, test plans, reports, change requests, and more.

Uploading a document:

1. Click + **Upload Document**
2. Select your file (PDF, Word, Excel, PowerPoint supported)
3. Choose a category from the list
4. Give it a name and an optional description
5. Add a change note — what is in this version
6. Choose visibility: **Team** (everyone can see it) or **Private** (only you)
7. Click **Upload**

Document categories: Requirements · Design · Review · Report · Change Request · Test Plan · Architecture · Meeting Notes · Other

Uploading a new version of an existing document: Find the document in the list and click + **Ver.** The previous version is retained and downloadable.

Viewing version history: Click **History** on any document to see all versions, who uploaded each one, when, and what changed.

Downloading: Click ↓ next to a document to download the latest version. Inside the History panel you can download any specific version.

Deleting: Document owners and managers can delete documents or individual versions.

4 — Search & Summarise

Natural language search across all uploaded documents.

Search tab: Type a question in plain English — for example:

| *What are the security requirements for the login system?*

OpenClaw searches across all documents and returns the most relevant sections, ranked by relevance. An AI summary at the top directly answers your question, citing which documents the answer came from.

Filter options:

- Restrict search to a specific category (e.g. Requirements only)
- Restrict to a specific document

Summarise tab: Select a document and a version to get a structured summary:

- Purpose
- Key Points
- Scope
- Action Items
- Open Questions

Compare tab: Select a document and two different versions to get a semantic comparison — what was added, removed, changed, and unchanged between them, with an overall verdict (Minor update / Moderate revision / Major revision / Complete rewrite).

Index Status tab: Shows which document versions are indexed and searchable. Newly uploaded documents are indexed automatically in the background. If a document shows as Pending, it will be ready within a few minutes.

5 — Complexity Analyser

What it does: Reads Requirements and Design documents and scores each section for implementation complexity — so the team knows what is hard before sprint planning.

Running an analysis:

1. Upload a Requirements or Design document via the Documents page
2. Go to **Complexity** in the sidebar
3. If the document appears under **Unanalysed Documents**, click ► **Analyse**
4. Analysis runs in the background — typically 1-2 minutes for a 10-section document
5. Click the document row to see results

Complexity ratings:

Rating	Score	Meaning
 Simple	0-2 factors	Standard implementation — junior-capable
 Moderate	3-4 factors	Requires experienced developer — design review recommended
 Complex	5-6 factors	Senior developer required — spike before estimating
 Critical	7+ factors	Architect review mandatory — high estimation risk

Drill-down: Click any section row to expand it. You will see:

- The AI's reasoning for the rating
- Each complexity factor with its category and a direct quote from the document that drove the score

6 — Notifications (Bell Icon)

The bell icon  in the top-right corner shows unread notifications.

You are notified when:

- A team member uploads a new document
- A member's risk is set to or escalated to Critical
- A member's sprint status changes to Delayed
- A complexity analysis you triggered has completed

Using the notification panel:

- Click the bell to open the panel
- Click a notification to go to the relevant page and mark it as read
- Click **Mark all read** to clear the badge

The panel refreshes automatically every 30 seconds.

Uploading from Your Own Machine (CLI)

If you prefer to upload files from the terminal rather than the browser, a command-line tool is available.

One-time setup:

```
bash

pip install requests
python3 openclaw-upload.py config --server http://<SERVER_IP>:8000
```

Upload a file:

```
bash

python3 openclaw-upload.py upload --file ./my-document.pdf --cate
```

Upload and trigger complexity analysis automatically:

```
bash
```

```
python3 openclaw-upload.py upload --file ./requirements.pdf --cat
```

Download all documents in a category:

```
bash
```

```
python3 openclaw-upload.py download --category Design
```

List documents on the server:

```
bash
```

```
python3 openclaw-upload.py list
```

Ask your manager for the `openclaw-upload.py` script and the server IP address.

Tips for Testing

- **Update your status daily** — the AI checks for stale updates and will send a reminder after 24 hours
 - **Upload at least one document** in each category you are testing
 - **Try a semantic search** after uploading — documents take 1-2 minutes to become searchable
 - **Run complexity analysis** on a Requirements or Design document and check if the ratings match your own assessment
 - **Check the Notifications bell** after a colleague uploads a document — it should appear within 30 seconds
-

Troubleshooting

Problem	What to do
Cannot reach the server	Check you are on the same network or VPN. Confirm the server IP with your manager.
Login fails	Check your email and password. Ask your manager to verify your account.
Document not appearing in search	Check the Index Status tab under Search — the document may still be indexing. Wait 2 minutes and try again.
Complexity shows Pending	Analysis is still running. Refresh the page after 2 minutes.
Notification bell not updating	The bell polls every 30 seconds. Wait briefly or reload the page.
CLI upload fails with "File too large"	The default limit is 200 MB. Contact your manager to increase it.
